Task 1: Prediction using Supervised Machine Learning

## In this regression task I tried to predict the percentage of marks that a student expected to score based upon the numbers of hours they studied

CSV\_Data can be found at http://bit.ly/w-data

Technical Stack: Scikit learn, Numpy Arrays, Pandas, Matplotlib

**Author: NEHA TRIPATHI** 

# Importing the required Libraries import numpy as np import pandas as pd import matplotlib.pyplot as plt from sklearn.model\_selection import train\_test\_split from sklearn.linear\_model import LinearRegression

#### # Reading Data From Remote Link url = r"https://raw.githubusercontent.com/AdiPersonalWorks/Random/master/student\_scores%20-%20student\_scores.csv"

Step 1: Reading the Data from Data Source

```
s_{data} = pd_{read_csv(url)}
         print ("Data import Successfully")
         s_data.head(10)
         Data import Successfully
Out[4]:
           Hours Scores
                     21
                     47
              5.1
                     27
```

Step 2 : Data Visualization In [5]: # Plotting the distribution of scores s\_data.plot(x= 'Hours', y= 'Scores', style = 'o')

8.5

3.5

1.5

9.2

5.5

2.7

plt.show()

In [6]:

75

30

20

88

60 81

25

plt.title('Hours vs Percentage') plt.xlabel('Hours Studied') plt.ylabel('Percentage Score')

```
Hours vs Percentage
      Scores
centage Score
  40
  20
Step 3: Data Preprocessing
```

# Step 4: Model Training

regressor.fit(X\_train.reshape(-1,1), y\_train)

X\_train, X\_test, y\_train, y\_test = train\_test\_split(X, y, test\_size= 0.2, random\_state = 0) regressor = LinearRegression()

plt.scatter(X, y)

plt.show()

print(X\_test) #Model Prediction

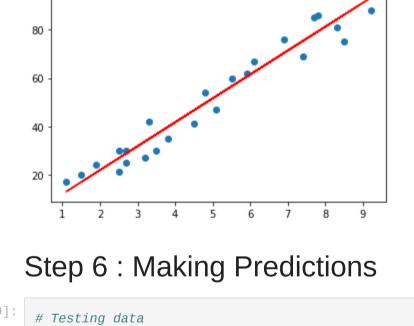

Out[10]:

plt.plot(X, line,color='red');

 $X = s_{data.iloc[:, :-1].values}$ y = s\_data.iloc[:, 1].values

## print("Training Complete") Training Complete

```
Step 5: Plotting the line of regression
# Plotting the lines of regression
 line = regressor.coef_*X+regressor.intercept_
 # Plotting for the test data
```

#### y\_pred = regressor.predict(X\_test) [[1.5] [3.2]

df = pd.DataFrame({'Actual' : y\_test, 'Predicted' : y\_pred})

print("Training Score:", regressor.score(X\_train, y\_train))

- Actual Predicted

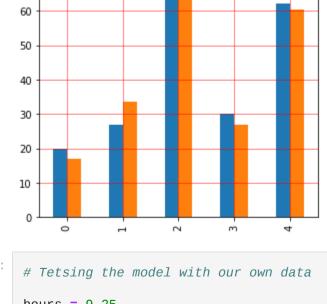

[7.4][2.5] [5.9]] Step 7: Comparing Actual Result to the Predicted Model Result. In [10]: # Comparing Actual Vs Predicted Result

**Actual Predicted** 

```
20 16.884145
27 33.732261
69 75.357018
30 26.794801
62 60.491033
```

print("Test Score:", regressor.score(X\_test, y\_test)) Training Score: 0.9515510725211552 Test Score: 0.9454906892105356 # Plotting the bar graph to depict the difference between the actual and predicted values.

df.plot(kind='bar', figsize=(5,5)) plt.grid(which='major',linewidth= '0.5',color='red') plt.grid(which='minor', linewidth ='0.5', color='blue') plt.show()

# Estimating training and test score

hours = 9.25 test = np.array([hours]) test = test.reshape(-1,1) own\_pred = regressor.predict(test)

Step 8: Evaluating the model

Predicted Score = 93.69173248737538

No of Hours = 9.25

print("No of Hours = {}".format(hours))

print("Predicted Score = {}".format(own\_pred[0]))

### The final step is to evaluate the performance of algorithm. This step is particularly important to compare how well different algorithm performs on a particular Dataset. Here different error have been calculated to compare the model performance and predict the accuracy. In [14]:

from sklearn import metrics print('Mean Absolute Error:', metrics.mean\_absolute\_error(y\_test, y\_pred))

print('Mean Squared Error:', metrics.mean\_squared\_error(y\_test,y\_pred)) print('Root Mean Squared Error:',np.sqrt(metrics.mean\_squared\_error(y\_test,y\_pred))) print('R-2:', metrics.r2\_score(y\_test, y\_pred)) Mean Absolute Error: 4.183859899002975 Mean Squared Error: 21.5987693072174 Root Mean Squared Error: 4.6474476121003665 R-2: 0.9454906892105356

R-2 gives the score of model fit and in this case we have R-2 = 0.9454906892105356 which is actally great score for this model.

Conclusion

I was successfully able to carry-out Prediction using Supervised ML task and was able to evaluate the model's Performance on various Parameters.

THANK YOU SO MUCH!!
